SOIL-CEMENT During its construction, soil-cement is compacted to a high density. As the cement hydrates, the mixture hardens in this dense state and becomes a structural slablike material. It does not consolidate further under traffic nor does it rut or shove during spring thaws. Soil-cement can bridge over local weak subgrade areas.

When built for equal load-carrying capacity, soil-cement is almost always less expensive than other low-cost pavements. Economy is achieved through the use or reuse of in-place or nearby borrow materials. No costly hauling of expensive, granular-base materials is required; thus, both energy and materials are conserved.
